

Earth friendly landscaping

Our earth is unfortunately one with a lot of problems these days. What with global warming and irregular weather patterns and melting of ice caps, we have come to learn that many things we took for granted are actually at stake. It is important that each of us realize at least now how each and every one of us can make a difference with our activities, in trying to make our planet one that can be lived in.

When landscaping a garden, there are many ways in which we can protect our children, the environment and even our pets from harm, all by maintaining a few simple things. One way is to make sure the plants you choose are those that are native to your area. These plants are better equipped to grow in the weather of your area, need less water and fertilizing and so are best suited for your garden. Add many varieties of plants to your garden. Along with the fact that it will make your garden look vibrant and alive, this also ensures that there is as much protection from pests as possible, as the more variety you have in your garden, the more controllable any attack from pests would be, and so the less pesticide you will need. It is also recommended that you mow high, as it is said that the taller the grass (3 inches is the recommended length) the less water you will need for it, and that it also promotes the growth of roots, and stops weeds from growing rapidly. This means your lawn will be both cheap and easier to maintain. This also means you will need less weedicide for the lawn. It is also recommended that natural fertilizers are used when planting the seeds into your garden, as these are less likely to cause any harm to the environment.

Knowledge is key, as in all other cases, when trying to make sure the garden you landscape is both a treat to the eyes and to your environment. Make sure you are aware of the type of plants that can be used in your area, what kind of water supply you have, and anything else that can affect the way your garden will turn out. Information on this topic can be found from the local garden shop, and even online, and so spend some time knowing what can be used so that it makes it easier when the planning is being done.

Any good garden designer and landscape designer will know at least the basics about earth friendly landscaping, so it is possible to discuss any doubts you have regarding it with the designer. Make sure you mention your requirements to be earth friendly to your designer, as that will make the task of finding the right kind of plants easier for the designer. When landscaping your garden, it may seem like there is too much to look into, but you can rest assured that the end product is something you will both enjoy and love. A garden is an integral part of any home, and is a place where many memories are made, and so it is imperative that it is a place of both beauty and joy. Making your garden earth friendly only ensures that it is something that is sustainable and worth the money spent on it.
